

EXECUTIVE SUMMARY

Optimesh Config Review Studio is a SaaS pre-flight compliance tool for network engineers in regulated industries. Engineers paste or upload a network configuration and receive a structured, audit-ready report — flagging syntax errors, security misconfigs, and deviations from organization-defined golden templates — **before any change touches production**. Zero deployment. No device access. Full value on day one.

THE PROBLEM

Network engineers review configurations before every change — multiple times per week. In regulated environments (pharma, medical devices, financial services), a single misconfiguration can cause a GxP violation, production outage, or failed compliance audit. Today, this review process is manual, inconsistent, and entirely dependent on individual engineer knowledge. No tool enforces organizational standards. No output is audit-ready. Free LLMs can generate configs but cannot check them against your org's specific policies.

THE THREE CORE MODULES

01 Golden Template Engine

The core moat. Teams define org-specific configuration standards that every review enforces automatically. No free LLM replicates institutional memory out of the box.

- Define required protocols, banned commands, mandatory authentication methods
- Enforce naming conventions, VLAN policies, and ACL structures org-wide
- Every config review flags deviations — with specific line references and remediation guidance
- Templates persist and improve over time, becoming a living compliance asset

02 Vendor & Firmware-Aware Linting

Syntax intelligence that knows the difference between IOS 15.x and IOS-XE 17.x, JunOS set vs. hierarchical format, and Arista and Palo Alto-specific quirks. Version-aware accuracy is what separates Optimesh from a generic prompt.

- Cisco IOS / IOS-XE / NX-OS version-specific validation
- Juniper JunOS set format and hierarchical format support
- Arista EOS and Palo Alto PAN-OS coverage
- Catches misconfigs that cause silent failures — not just syntax errors

03 Compliance-Formatted Pre-Flight Report

Exportable PDF or JSON output formatted for change management attachment. A QA manager or auditor can read and sign off on it — this is the output that justifies budget in regulated environments.

- Documents what was checked, what passed, what failed, and why
- Formatted for direct attachment to ServiceNow or Jira change records
- Produces audit trail that satisfies GxP, SOX, and PCI-DSS change documentation requirements
- Timestamped and engineer-attributed for compliance chain-of-custody

STRATEGIC RATIONALE

Config Review Studio is not Optimesh's primary revenue vehicle — it is the wedge that earns the right to sell Risk Intelligence.

As a zero-deployment, day-one-value product, it installs Optimesh into the daily workflow of network engineers who become internal champions for the device-dependent Risk Intelligence platform. Every config reviewed also reveals environment signal — vendors, topology, firmware versions — that sharpens both product and sales conversations. Target ARR of \$500K–\$800K is achievable within 18 months focused on regulated industries where the compliance output has audit value beyond productivity convenience.

PRICING MODEL

Tier	Monthly Price	Target Customer	Device Footprint
Startup	\$800	Small IT teams	1–50 devices
Mid-Market	\$2,500	Regulated industries	50–500 devices
Enterprise	Custom	Multi-site / global	500+ devices

COMPETITIVE POSITIONING

	Optimesh	Gluware	NetBox Copilot	Free LLMs
Zero deployment	✓	X	X	✓
